DOM207-DOM3007-DOM6401: MP3

BACKGROUND

Several years back, I was hired as a consultant as a consultant by the IMF (International Monetary Fund – *https://www.imf.org/en/home*) in one of their projects that involved the characterization of the individual issues or attributes of IT workers employed in IT companies from across the globe.

This MP3 is a much simplified and scaled-down version in terms of details and complexity of the actual project. I've also shared with you a greatly abridged version of the original data file that was provided to my team by the IMF to be used in the project.

INTRODUCTION:

- ✓ **As you may well realize, this MP3 is a HARD project.**
- ✓ It's the interpretation of the results that's most difficult part of this project. It requires knowledge of global business and employment for high-tech workers.

WORK AND SUBMISSION REQUIREMENTS AND GUIDELINES

- ✓ For this project, you must work in a group of **no more than 2 (only in an exceptional case 3) students per group**.
- ✓ Solo work is also allowed and appreciated.
- ✓ Each group must submit only one project report **on BB**.
- ✓ Each submission must contain the following items:
    1) A report in word doc or PDF with an appropriate title page. This page should contain a title for the project, **your name and your collaborator name(s)**, your roll #, course name and #, and your instructor's name
    2) The report must be divided into at least the following sections (**section heading MANDATORY**):
    3) **Introduction** (say what you're set out to achieve in this project)
    4) **Data preprocessing** (provide details of all data cleansing steps you've undertaken, if any)
    5) **Data visualization** (provide some worthwhile charts, diagrams, etc. for visualization – do not provide useless diagrams – you'll be penalized if you do)
    6) **Hypotheses or theory building** (if appropriate)
    7) **Analysis** (Verification of model assumptions, and **complete** technical analysis with justifications for all of your findings). You may insert a few helpful screenshots of your work (C/P from your output). These must be relevant and persuasive. **Do not put rubbish diagrams or figures – you'll be penalized if you do!!!**
    8) **Recommendations** **Your final recommendations with proper justifications** (based on your findings)
    9) **References**
    10) **Submit the project report (Word doc or PDF) and your supporting R or Python files containing the complete analysis (project files and .R or .py files)**.

11) There's no fixed requirement for word or page limit for the report. However, the material in it should be substantial and meaningful, exactly like a project report you'd submit to your client

12) **NOTE**: **SUBMISSION ON BB is completely your responsibility**. **Submit well BEFORE the deadline. Last-minute technical failures (BB problems; network outages; computer crashes; dogs or cats or grandpas or grandmas or interviews) or sickness will NOT be considered in any way (if you're sick, ask your partner ASAP to submit). Failure to conform to these requirements results in a zero, meaning in the corporate context, your company loses the contract. So, be responsible and work in a professional capacity.**

VERY IMPORTANT:

- The project must be as formal as possible, as a practice of how things are done in the industry and the real world
- **Project submission policy as already announced**
- If you do not follow the above directions, **you'll be heavily penalized**.
- **The grading will be TOUGH**
- **Project submission deadline is inflexible and strictly enforced!!**

PROJECT FOR Company DOM207-DOM3007-DOM6401

This project is contracted out to the consulting firm ***DOM207-DOM3007-DOM6401*** by the IMF. It concerns individual issues of information and communications technology (ICT) workers in 37 countries of the world. There're are nine individual issues in all, which are considered important by the economists of the IMF.

As you can see in the data file, two scores for each individual issue have been recorded by the IMF. You don't need to know how the IMF computed these scores. The IMF is interested in knowing how best the countries can be categorized based on the scores of the individual issues. How you do the grouping and using what scores or criteria and so on is entirely your job (you must perform the grouping using both scores and see if there're any actual differences between the outcomes – lot of trial and error will be required). Ultimately, you must convince (by applying your analytics expertise and knowledge of business and economics) the IMF that your categorization of the countries based on these individual issues of the IT employees makes good sense from a macroeconomic perspective.

The individual issues that the IMF has collected are described in the file ***ICTInvFldDesc.pdf***. The actual data file is ***ICTIndiv.xlsx***.

Keep in mind

The interpretation of the results is the hardest part. That'll take your maximum time in MP3. Here, multidisciplinary knowledge of business and economics will come to your aid.
